COS30045 Data Visualisation

Exercise 1.6 D3 Drawing with Data - Scatter Pot

	(47, 13)
ILO	Create web-based interactive visualisations using real-world data sets.
Aim:	Use D3 to generate elements on a webpage to create a scatter plot from a data set.
Resources:	Textbook: Chapter 6 Drawing with Data - Murray (2017) Interactive Data Visualisation (2nd Ed) on ProQuest Murray on Safari Web Resources: Videos:
Demonstration	If you are required to demonstrate this exercise we will be looking for: - code that is appropriate for exercise, well formatted and commented - code that runs correctly and meets the requirements specified in this exercise - an explain programming features and concepts in the code - the ability to successfully edit code to change a specified feature of the program

Note: This Exercise Guide is not meant to be fully explanatory. You may also need to work through the examples in the text book *Interactive Data Visualisation* for the Web by Murray.

Overview

In this tutorial we will start using D3 to draw a scatter plot. At the end of this exercise you should end up with a scatter plot drawn using D3 generated SVGs that looks something like this:

Drawing with Data - Scatter Plot

Feel free to choose your own data and styling at the end.

Note: This Task Guide is not meant to be fully explanatory. You may also need to work through the matching example in the text book *Interactive Data Visualisation* for the Web by Murray.

Step 1: Start with the code from Task 2.2

We will start with the code from the previous bar chart task.

Step 2 Change the data set

A scatter plot is a representation of two sets of data plotted against each other. We will use an array to represent the data for the scatter plot. We will have a primary array (between the first set of square brackets) containing a secondary array. The secondary array consists two numbers representing the scatter plot data points. Feel free to make up your own data set or use this one from Murray:

Step 3 Change from rectangles to circles

Scatter plots points are circles, so change the reference to rectangles from your Drawing with Data - Bar Chart exercise code to circles. You may also remember from our SVG exercise that the position and size of circles and rectangles are specified differently. Change the x and y coordinates for your circle objects to read in values from the data set and use a radius of 5.

```
svg.selectAll("circle")
     .data(dataset)
    .enter()
    .append("circle")
                                                    Refer to data
    .attr("cx", function(d, i) {
                                                    in the array -
         return d[0]; ___
                                                    d[0] will give
                                                    you the first
    })
                                                    value and d[1]
    .attr("cy", function(d) {
                                                    the second
                                                    value
         return d[1];
    })
    .attr("r", 5)
     .attr("fill", "slategrey");
```

Drawing with Data - Scatter Plot

Optional: Imagine one of the data points is very important. Style a data point so that appears red.

Step 4 Add labels to the Scatter Plot

To add labels you first need to create and add all the text labels. To add the labels to the SVG start by attaching text to the data set:

```
svg.selectAll("text")
    .data(dataset)
    .enter()
    .append("text");
```

If you like you can check the DOM and see that there is a set of empty text labels waiting to go. Next we need to write out the label:

```
svg.selectAll("text")
    .data(dataset)
    .enter()
    .append("text")
    .text(function(d) {
        return d[0] + "," +d[1];
    });
```

Again, if you run this you won't see any text labels, but you will see the data attached to the text in the DOM. To make our labels appear we need to give them coordinates. Obviously we want them near our data points. Use the same type of method we used to position the circles above.

Finally you add some styling to the text to make it all look nice!
